

Tab 1

Generations of Computers

1. *Introduction*

A **computer** is an electronic device that accepts data as input, processes it according to given instructions, stores information, and produces useful output.

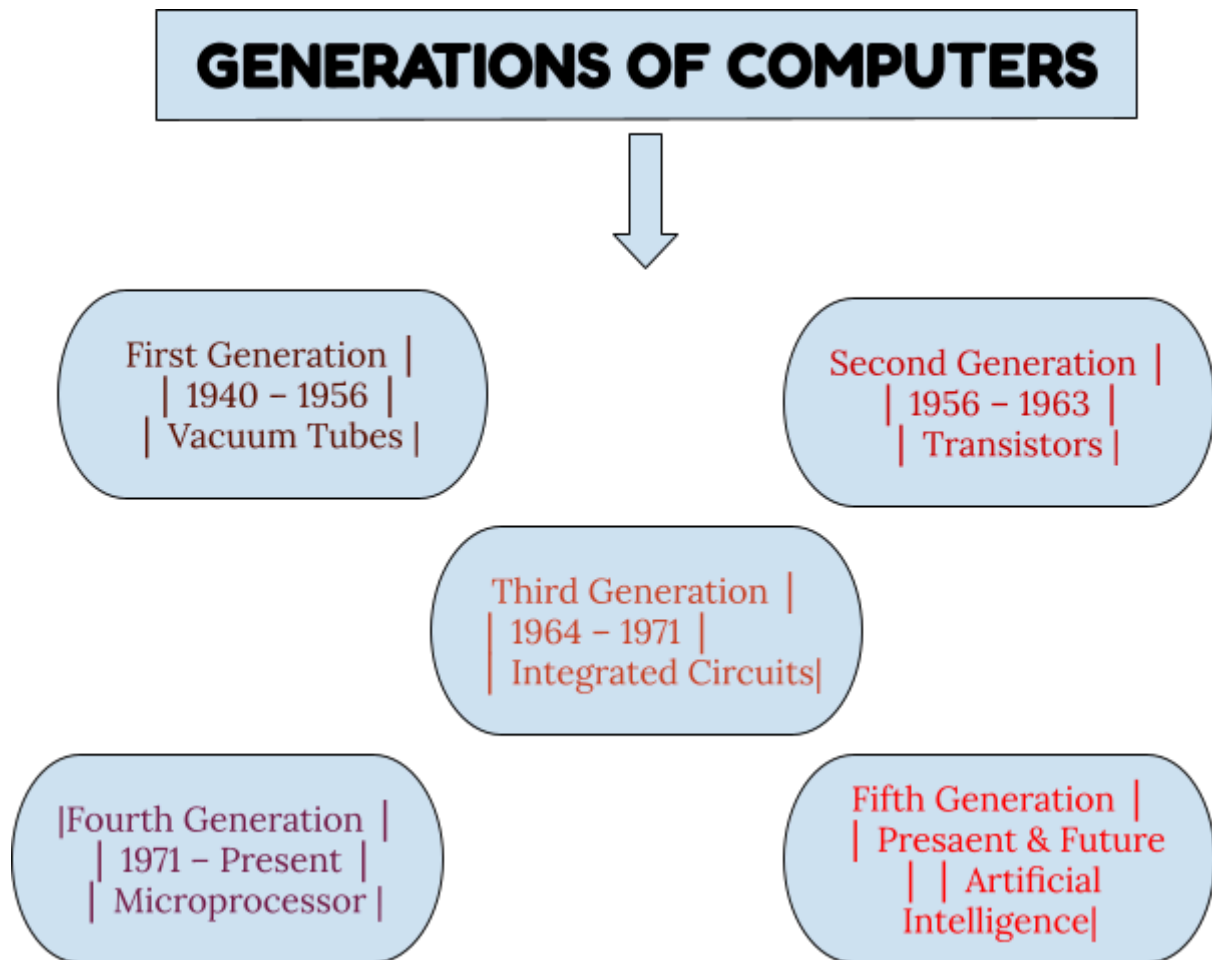

The development of computers took place in different stages. Each stage brought improvements in **speed, size, storage, reliability, cost, and technology**. These stages are called the **generations of computers**.

There are mainly five generations of computers:

1. First Generation – Vacuum Tubes
2. Second Generation – Transistors
3. Third Generation – Integrated Circuits (IC)
4. Fourth Generation – Microprocessors

Fifth Generation | | Present & Future | | Artificial Intelligence

2. Flowchart of Generations of Computers
